

# Package: Colossus (via r-universe)

September 12, 2024

**Type** Package

**Title** ``Risk Model Regression and Analysis with Complex Non-Linear Models''

**Version** 1.1.3

**URL** <https://ericgiunta.github.io/Colossus/>,  
<https://github.com/ericgiunta/Colossus>

**BugReports** <https://github.com/ericgiunta/Colossus/issues>

**Description** Performs survival analysis using general non-linear models. Risk models can be the sum or product of terms. Each term is the product of exponential/linear functions of covariates. Additionally sub-terms can be defined as a sum of exponential, linear threshold, and step functions. Cox Proportional hazards  
<[https://en.wikipedia.org/wiki/Proportional\\_hazards\\_model](https://en.wikipedia.org/wiki/Proportional_hazards_model)>, Poisson <[https://en.wikipedia.org/wiki/Poisson\\_regression](https://en.wikipedia.org/wiki/Poisson_regression)>, and Fine-Grey competing risks  
<<https://www.pubichealth.columbia.edu/research/population-health-methods/competing-risk-analysis>> regression are supported. This work was sponsored by NASA Grant 80NSSC19M0161 through a subcontract from the National Council on Radiation Protection and Measurements (NCRP). The computing for this project was performed on the Beocat Research Cluster at Kansas State University, which is funded in part by NSF grants CNS-1006860, EPS-1006860, EPS-0919443, ACI-1440548, CHE-1726332, and NIH P20GM113109.

**License** GPL (>= 3)

**Imports** Rcpp, data.table, parallel, stats, utils, rlang, callr, stringr, processx

**LinkingTo** Rcpp, RcppEigen, testthat

**SystemRequirements** make

**RoxygenNote** 7.3.2

**Encoding** UTF-8

Check\_Dupe\_Columns      *checks for duplicated column names*

---

## Description

Check\_Dupe\_Columns checks for duplicated columns, columns with the same values, and columns with single value. Currently not updated for multi-terms

## Usage

```
Check_Dupe_Columns(df, cols, term_n, verbose = 0, factor_check = FALSE)
```

## Arguments

df	a data.table containing the columns of interest
cols	columns to check
term_n	term numbers for each element of the model
verbose	integer valued 0-4 controlling what information is printed to the terminal. Each level includes the lower levels. 0: silent, 1: errors printed, 2: warnings printed, 3: notes printed, 4: debug information printed. Errors are situations that stop the regression, warnings are situations that assume default values that the user might not have intended, notes provide information on regression progress, and debug prints out C++ progress and intermediate results. The default level is 2 and True/False is converted to 3/0.
factor_check	a boolean used to skip comparing columns of the form ?_? with the same initial string, which is used for factored columns

**Value**

returns the usable columns

**See Also**

Other Data Cleaning Functions: [Check\\_Trunc\(\)](#), [Check\\_Verbose\(\)](#), [Correct\\_Formula\\_Order\(\)](#), [Date\\_Shift\(\)](#), [Def\\_Control\(\)](#), [Def\\_Control\\_Guess\(\)](#), [Def\\_model\\_control\(\)](#), [Def\\_modelform\\_fix\(\)](#), [Joint\\_Multiple\\_Events\(\)](#), [Replace\\_Missing\(\)](#), [Time\\_Since\(\)](#), [factorize\(\)](#), [factorize\\_par\(\)](#), [gen\\_time\\_dep\(\)](#), [interact\\_them\(\)](#)

**Examples**

```
library(data.table)
a <- c(0,1,2,3,4,5,6)
b <- c(1,2,3,4,5,6,7)
c <- c(0,1,2,1,0,1,0)
df <- data.table::data.table("a"=a,"b"=b,"c"=c)
cols <- c("a","b","c")
term_n <- c(0,0,1)
unique_cols <- Check_Dupe_Columns(df, cols, term_n)
```

**Check\_Trunc**

*Applies time duration truncation limits to create columns for Cox model*

**Description**

Check\_Trunc creates columns to use for truncation

**Usage**

```
Check_Trunc(df, ce, verbose = 0)
```

**Arguments**

df	a data.table containing the columns of interest
ce	columns to check for truncation, (t0, t1, event)
verbose	integer valued 0-4 controlling what information is printed to the terminal. Each level includes the lower levels. 0: silent, 1: errors printed, 2: warnings printed, 3: notes printed, 4: debug information printed. Errors are situations that stop the regression, warnings are situations that assume default values that the user might not have intended, notes provide information on regression progress, and debug prints out C++ progress and intermediate results. The default level is 2 and True/False is converted to 3/0.

**Value**

returns the updated data and time period columns

**See Also**

Other Data Cleaning Functions: [Check\\_Dupe\\_Columns\(\)](#), [Check\\_Verbose\(\)](#), [Correct\\_Formula\\_Order\(\)](#), [Date\\_Shift\(\)](#), [Def\\_Control\(\)](#), [Def\\_Control\\_Guess\(\)](#), [Def\\_model\\_control\(\)](#), [Def\\_modelform\\_fix\(\)](#), [Joint\\_Multiple\\_Events\(\)](#), [Replace\\_Missing\(\)](#), [Time\\_Since\(\)](#), [factorize\(\)](#), [factorize\\_par\(\)](#), [gen\\_time\\_dep\(\)](#), [interact\\_them\(\)](#)

**Examples**

```
library(data.table)

df <- data.table::data.table("UserID"=c(112, 114, 213, 214, 115, 116, 117),
                            "Starting_Age"=c(18, 20, 18, 19, 21, 20, 18),
                            "Ending_Age"=c(30, 45, 57, 47, 36, 60, 55),
                            "Cancer_Status"=c(0, 0, 1, 0, 1, 0, 0))
# For the interval case
time1 <- "Starting_Age"
time2 <- "Ending_Age"
ce <- c("%trunc%", "Ending_Age")
val <- Check_Trunc(df, ce)
df <- val$df
ce <- val$ce
```

**Check\_Verbose**

*General purpose verbosity check*

**Description**

Check\_Verbose checks and assigns verbosity values

**Usage**

```
Check_Verbose(verbose)
```

**Arguments**

verbose	integer valued 0-4 controlling what information is printed to the terminal. Each level includes the lower levels. 0: silent, 1: errors printed, 2: warnings printed, 3: notes printed, 4: debug information printed. Errors are situations that stop the regression, warnings are situations that assume default values that the user might not have intended, notes provide information on regression progress, and debug prints out C++ progress and intermediate results. The default level is 2 and True/False is converted to 3/0.
---------	---

**Value**

returns correct verbose value

**See Also**

Other Data Cleaning Functions: [Check\\_Dupe\\_Columns\(\)](#), [Check\\_Trunc\(\)](#), [Correct\\_Formula\\_Order\(\)](#), [Date\\_Shift\(\)](#), [Def\\_Control\(\)](#), [Def\\_Control\\_Guess\(\)](#), [Def\\_model\\_control\(\)](#), [Def\\_modelform\\_fix\(\)](#), [Joint\\_Multiple\\_Events\(\)](#), [Replace\\_Missing\(\)](#), [Time\\_Since\(\)](#), [factorize\(\)](#), [factorize\\_par\(\)](#), [gen\\_time\\_dep\(\)](#), [interact\\_them\(\)](#)

**Correct\_Formula\_Order** *Corrects the order of terms/formula/etc*

**Description**

`Correct_Formula_Order` checks the order of formulas given and corrects any ordering issues, orders alphabetically, by term number, etc.

**Usage**

```
Correct_Formula_Order(
  term_n,
  tform,
  keep_constant,
  a_n,
  names,
  der_iden = 0,
  cons_mat = matrix(c(0)),
  cons_vec = c(0),
  verbose = FALSE,
  model_control = list(para_number = 0)
)
```

**Arguments**

<code>term_n</code>	term numbers for each element of the model
<code>tform</code>	list of string function identifiers, used for linear/step
<code>keep_constant</code>	binary values to denote which parameters to change
<code>a_n</code>	list of initial parameter values, used to determine number of parameters. May be either a list of vectors or a single vector.
<code>names</code>	columns for elements of the model, used to identify data columns
<code>der_iden</code>	number for the subterm to test derivative at, only used for testing runs with a single varying parameter, should be smaller than total number of parameters. indexed starting at 0

cons_mat	Matrix containing coefficients for system of linear constraints, formatted as matrix
cons_vec	Vector containing constants for system of linear constraints, formatted as vector
verbose	integer valued 0-4 controlling what information is printed to the terminal. Each level includes the lower levels. 0: silent, 1: errors printed, 2: warnings printed, 3: notes printed, 4: debug information printed. Errors are situations that stop the regression, warnings are situations that assume default values that the user might not have intended, notes provide information on regression progress, and debug prints out C++ progress and intermediate results. The default level is 2 and True/False is converted to 3/0.
model_control	controls which alternative model options are used, see <code>Def_model_control()</code> for options and <code>vignette("Control_Options")</code> for further details

**Value**

returns the corrected lists

**See Also**

Other Data Cleaning Functions: `Check_Dupe_Columns()`, `Check_Trunc()`, `Check_Verbose()`, `Date_Shift()`, `Def_Control()`, `Def_Control_Guess()`, `Def_model_control()`, `Def_modelform_fix()`, `Joint_Multiple_Events()`, `Replace_Missing()`, `Time_Since()`, `factorize()`, `factorize_par()`, `gen_time_dep()`, `interact_them()`

**Examples**

```
library(data.table)
## basic example code reproduced from the starting-description vignette

term_n <- c(0,1,1,0,0)
tform <- c("loglin",'quad_slope','lin', "lin_int", "lin_slope")
keep_constant <- c(0,0,0,1,0)
a_n <- c(1,2,3,4,5)
names <- c("a","a","a","a","a")
val <- Correct_Formula_Order(term_n, tform, keep_constant,
                             a_n, names, cons_mat=matrix(c(0)),
                             cons_vec=c(0))

term_n <- val$term_n
tform <- val$tform
keep_constant <- val$keep_constant
a_n <- val$a_n
der_iden <- val$der_iden
names <- val$names
```

---

Cox_Relative_Risk	<i>Calculates hazard ratios for a reference vector</i>
-------------------	--

---

## Description

RunCoxRegression uses user provided data, vectors specifying the model, and options to calculate relative risk for every row in the provided data

## Usage

```
Cox_Relative_Risk(
  df,
  time1,
  time2,
  event0,
  names,
  term_n,
  tform,
  keep_constant,
  a_n,
  modelform,
  fir,
  control,
  model_control = list()
)
```

## Arguments

<code>df</code>	a data.table containing the columns of interest
<code>time1</code>	column used for time period starts
<code>time2</code>	column used for time period end
<code>event0</code>	column used for event status
<code>names</code>	columns for elements of the model, used to identify data columns
<code>term_n</code>	term numbers for each element of the model
<code>tform</code>	list of string function identifiers, used for linear/step
<code>keep_constant</code>	binary values to denote which parameters to change
<code>a_n</code>	list of initial parameter values, used to determine number of parameters. May be either a list of vectors or a single vector.
<code>modelform</code>	string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E
<code>fir</code>	term number for the initial term, used for models of the form $T_0 * f(T_i)$ in which the order matters
<code>control</code>	list of parameters controlling the convergence, see <code>Def_Control()</code> for options or <code>vignette("Control_Options")</code>
<code>model_control</code>	controls which alternative model options are used, see <code>Def_model_control()</code> for options and <code>vignette("Control_Options")</code> for further details

**Value**

returns a list of the final results

**See Also**

Other Plotting Wrapper Functions: [RunCoxPlots\(\)](#)

**Examples**

```
library(data.table)
## basic example code reproduced from the starting-description vignette

df <- data.table::data.table("UserID"=c(112, 114, 213, 214, 115, 116, 117),
  "Starting_Age"=c(18, 20, 18, 19, 21, 20, 18),
  "Ending_Age"=c(30, 45, 57, 47, 36, 60, 55),
  "Cancer_Status"=c(0, 0, 1, 0, 1, 0, 0),
  "a"=c(0, 1, 1, 0, 1, 0, 1),
  "b"=c(1, 1.1, 2.1, 2, 0.1, 1, 0.2),
  "c"=c(10, 11, 10, 11, 12, 9, 11),
  "d"=c(0, 0, 1, 1, 1, 1))

# For the interval case
time1 <- "Starting_Age"
time2 <- "Ending_Age"
event <- "Cancer_Status"
names <- c('a','b','c','d')
term_n <- c(0,1,1,2)
fir <- 0
tform <- c("loglin","lin","lin","plin")
modelform <- "M"
a_n <- c(1.1, 0.1, 0.2, 0.5) #used to test at a specific point

keep_constant <- c(0,0,0,0)

control <- list("ncores"=2,'lr' = 0.75,'maxiter' = 5,'halfmax' = 5,
  'epsilon' = 1e-3,
  'deriv_epsilon' = 1e-3, 'abs_max'=1.0, 'change_all'=TRUE,
  'dose_abs_max'=100.0,'verbose'=FALSE, 'ties'='breslow','double_step'=1)

e <- Cox_Relative_Risk(df, time1, time2, event, names, term_n, tform,
  keep_constant, a_n, modelform, fir, control)
```

**Description**

Date\_Shift generates a new dataframe with a column containing time difference in a given unit

**Usage**

```
Date_Shift(df, dcol0, dcol1, col_name, units = "days")
```

**Arguments**

df	a data.table containing the columns of interest
dcol0	list of starting month, day, and year
dcol1	list of ending month, day, and year
col_name	vector of new column names
units	time unit to use

**Value**

returns the updated dataframe

**See Also**

Other Data Cleaning Functions: [Check\\_Dupe\\_Columns\(\)](#), [Check\\_Trunc\(\)](#), [Check\\_Verbose\(\)](#), [Correct\\_Formula\\_Order\(\)](#), [Def\\_Control\(\)](#), [Def\\_Control\\_Guess\(\)](#), [Def\\_model\\_control\(\)](#), [Def\\_modelform\\_fix\(\)](#), [Joint\\_Multiple\\_Events\(\)](#), [Replace\\_Missing\(\)](#), [Time\\_Since\(\)](#), [factorize\(\)](#), [factorize\\_par\(\)](#), [gen\\_time\\_dep\(\)](#), [interact\\_them\(\)](#)

**Examples**

```
library(data.table)
m0 <- c(1,1,2,2)
m1 <- c(2,2,3,3)
d0 <- c(1,2,3,4)
d1 <- c(6,7,8,9)
y0 <- c(1990,1991,1997,1998)
y1 <- c(2001,2003,2005,2006)
df <- data.table::data.table("m0"=m0,"m1"=m1,"d0"=d0,"d1"=d1,"y0"=y0,"y1"=y1)
df <- Date_Shift(df,c("m0","d0","y0"),c("m1","d1","y1"),"date_since")
```

**Def\_Control**

*Automatically assigns missing control values*

**Description**

Def\_Control checks and assigns default values

**Usage**

```
Def_Control(control)
```

**Arguments**

`control` list of parameters controlling the convergence, see `Def_Control()` for options or `vignette("Control_Options")`

**Value**

returns a filled list

**See Also**

Other Data Cleaning Functions: `Check_Dupe_Columns()`, `Check_Trunc()`, `Check_Verbose()`, `Correct_Formula_Order()`, `Date_Shift()`, `Def_Control_Guess()`, `Def_model_control()`, `Def_modelform_fix()`, `Joint_Multiple_Events()`, `Replace_Missing()`, `Time_Since()`, `factorize()`, `factorize_par()`, `gen_time_dep()`, `interact_them()`

**Examples**

```
library(data.table)
control <- list("ncores"=2, 'lr' = 0.75, 'maxiter' = 5, 'ties'='breslow', 'double_step'=1)
control <- Def_Control(control)
```

`Def_Control_Guess`      *Automatically assigns missing guessing control values*

**Description**

`Def_Control_Guess` checks and assigns default values

**Usage**

```
Def_Control_Guess(guesses_control, a_n)
```

**Arguments**

`guesses_control` list of parameters to control how the guessing works, see `Def_Control_Guess()` for options or `vignette("Control_Options")`

`a_n` list of initial parameter values, used to determine number of parameters. May be either a list of vectors or a single vector.

**Value**

returns a filled list

**See Also**

Other Data Cleaning Functions: [Check\\_Dupe\\_Columns\(\)](#), [Check\\_Trunc\(\)](#), [Check\\_Verbose\(\)](#), [Correct\\_Formula\\_Order\(\)](#), [Date\\_Shift\(\)](#), [Def\\_Control\(\)](#), [Def\\_model\\_control\(\)](#), [Def\\_modelform\\_fix\(\)](#), [Joint\\_Multiple\\_Events\(\)](#), [Replace\\_Missing\(\)](#), [Time\\_Since\(\)](#), [factorize\(\)](#), [factorize\\_par\(\)](#), [gen\\_time\\_dep\(\)](#), [interact\\_them\(\)](#)

**Examples**

```
library(data.table)
guesses_control <- list("maxiter"=10, "guesses"=10,
    "loglin_min"=-1, "loglin_max"=1, "loglin_method"="uniform")
a_n <- c(0.1,2,1.3)
guesses_control <- Def_Control_Guess(guesses_control, a_n)
```

Def_modelform_fix	<i>Automatically assigns geometric-mixture values and checks that a valid modelform is used</i>
-------------------	---

**Description**

Def\_model\_control checks and assigns default values for modelform options

**Usage**

```
Def_modelform_fix(control, model_control, modelform, term_n)
```

**Arguments**

- |               |  |
|---------------|--|
| control       | list of parameters controlling the convergence, see Def_Control() for options or vignette("Control_Options")                               |
| model_control | controls which alternative model options are used, see Def_model_control() for options and vignette("Control_Options") for further details |
| modelform     | string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E  |
| term_n        | term numbers for each element of the model   |

**Value**

returns a filled list

**See Also**

Other Data Cleaning Functions: [Check\\_Dupe\\_Columns\(\)](#), [Check\\_Trunc\(\)](#), [Check\\_Verbose\(\)](#), [Correct\\_Formula\\_Order\(\)](#), [Date\\_Shift\(\)](#), [Def\\_Control\(\)](#), [Def\\_Control\\_Guess\(\)](#), [Def\\_model\\_control\(\)](#), [Joint\\_Multiple\\_Events\(\)](#), [Replace\\_Missing\(\)](#), [Time\\_Since\(\)](#), [factorize\(\)](#), [factorize\\_par\(\)](#), [gen\\_time\\_dep\(\)](#), [interact\\_them\(\)](#)

## Examples

```
library(data.table)
control <- list("ncores"=2,'lr' = 0.75,'maxiter' = 5, 'ties'='breslow','double_step'=1)
control <- Def_Control(control)
model_control <- list("single"=TRUE)
model_control <- Def_model_control(model_control)
term_n <- c(0,1,1)
modelform <- 'a'
val <- Def_modelform_fix(control,model_control,modelform,term_n)
model_control <- val$model_control
modelform <- val$modelform
```

**Def\_model\_control**      *Automatically assigns missing model control values*

## Description

Def\_model\_control checks and assigns default values

## Usage

```
Def_model_control(control)
```

## Arguments

control	list of parameters controlling the convergence, see Def_Control() for options or vignette("Control_Options")
---------	--

## Value

returns a filled list

## See Also

Other Data Cleaning Functions: [Check\\_Dupe\\_Columns\(\)](#), [Check\\_Trunc\(\)](#), [Check\\_Verbose\(\)](#), [Correct\\_Formula\\_Order\(\)](#), [Date\\_Shift\(\)](#), [Def\\_Control\(\)](#), [Def\\_Control\\_Guess\(\)](#), [Def\\_modelform\\_fix\(\)](#), [Joint\\_Multiple\\_Events\(\)](#), [Replace\\_Missing\(\)](#), [Time\\_Since\(\)](#), [factorize\(\)](#), [factorize\\_par\(\)](#), [gen\\_time\\_dep\(\)](#), [interact\\_them\(\)](#)

## Examples

```
library(data.table)
control <- list("single"=TRUE)
control <- Def_model_control(control)
```

factorize	<i>Splits a parameter into factors</i>
-----------	--

## Description

factorize uses user provided list of columns to define new parameter for each unique value and update the data.table. Not for interaction terms

## Usage

```
factorize(df, col_list, verbose = 0)
```

## Arguments

df	a data.table containing the columns of interest
col_list	an array of column names that should have factor terms defined
verbose	integer valued 0-4 controlling what information is printed to the terminal. Each level includes the lower levels. 0: silent, 1: errors printed, 2: warnings printed, 3: notes printed, 4: debug information printed. Errors are situations that stop the regression, warnings are situations that assume default values that the user might not have intended, notes provide information on regression progress, and debug prints out C++ progress and intermediate results. The default level is 2 and True/False is converted to 3/0.

## Value

returns a list with two named fields. df for the updated dataframe, and cols for the new column names

## See Also

Other Data Cleaning Functions: [Check\\_Dupe\\_Columns\(\)](#), [Check\\_Trunc\(\)](#), [Check\\_Verbose\(\)](#), [Correct\\_Formula\\_Order\(\)](#), [Date\\_Shift\(\)](#), [Def\\_Control\(\)](#), [Def\\_Control\\_Guess\(\)](#), [Def\\_model\\_control\(\)](#), [Def\\_modelform\\_fix\(\)](#), [Joint\\_Multiple\\_Events\(\)](#), [Replace\\_Missing\(\)](#), [Time\\_Since\(\)](#), [factorize\\_par\(\)](#), [gen\\_time\\_dep\(\)](#), [interact\\_them\(\)](#)

## Examples

```
library(data.table)
a <- c(0,1,2,3,4,5,6)
b <- c(1,2,3,4,5,6,7)
c <- c(0,1,2,1,0,1,0)
df <- data.table::data.table("a"=a,"b"=b,"c"=c)
col_list <- c("c")
val <- factorize(df,col_list)
df <- val$df
new_col <- val$cols
```

---

factorize_par	<i>Splits a parameter into factors in parallel</i>
---------------	--

---

## Description

factorize\_par uses user provided list of columns to define new parameter for each unique value and update the data.table. Not for interaction terms

## Usage

```
factorize_par(df, col_list, verbose = 0, nthreads = as.numeric(detectCores()))
```

## Arguments

df	a data.table containing the columns of interest
col_list	an array of column names that should have factor terms defined
verbose	integer valued 0-4 controlling what information is printed to the terminal. Each level includes the lower levels. 0: silent, 1: errors printed, 2: warnings printed, 3: notes printed, 4: debug information printed. Errors are situations that stop the regression, warnings are situations that assume default values that the user might not have intended, notes provide information on regression progress, and debug prints out C++ progress and intermediate results. The default level is 2 and True/False is converted to 3/0.
nthreads	number of threads to use, do not use more threads than available on your machine

## Value

returns a list with two named fields. df for the updated dataframe, and cols for the new column names

## See Also

Other Data Cleaning Functions: [Check\\_Dupe\\_Columns\(\)](#), [Check\\_Trunc\(\)](#), [Check\\_Verbose\(\)](#), [Correct\\_Formula\\_Order\(\)](#), [Date\\_Shift\(\)](#), [Def\\_Control\(\)](#), [Def\\_Control\\_Guess\(\)](#), [Def\\_model\\_control\(\)](#), [Def\\_modelform\\_fix\(\)](#), [Joint\\_Multiple\\_Events\(\)](#), [Replace\\_Missing\(\)](#), [Time\\_Since\(\)](#), [factorize\(\)](#), [gen\\_time\\_dep\(\)](#), [interact\\_them\(\)](#)

## Examples

```
library(data.table)
a <- c(0,1,2,3,4,5,6)
b <- c(1,2,3,4,5,6,7)
c <- c(0,1,2,1,0,1,0)
df <- data.table::data.table("a"=a,"b"=b,"c"=c)
col_list <- c("c")
val <- factorize_par(df,col_list,TRUE,2)
```

```
df <- val$df
new_col <- val$cols
```

Gather\_Guesses\_CPP      *Performs checks to gather a list of guesses and iterations*

## Description

Gather\_Guesses\_CPP called from within R, uses a list of options and the model definition to generate a list of parameters and iterations that do not produce errors

## Usage

```
Gather_Guesses_CPP(
  df,
  dfc,
  names,
  term_n,
  tform,
  keep_constant,
  a_n,
  x_all,
  a_n_default,
  modelform,
  fir,
  control,
  guesses_control,
  model_control = list()
)
```

## Arguments

<b>df</b>	a data.table containing the columns of interest
<b>dfc</b>	vector matching subterm number to matrix column
<b>names</b>	columns for elements of the model, used to identify data columns
<b>term_n</b>	term numbers for each element of the model
<b>tform</b>	list of string function identifiers, used for linear/step
<b>keep_constant</b>	binary values to denote which parameters to change
<b>a_n</b>	list of initial parameter values, used to determine number of parameters. May be either a list of vectors or a single vector.
<b>x_all</b>	covariate matrix
<b>a_n_default</b>	center of parameter distribution guessing scope
<b>modelform</b>	string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E

<code>fir</code>	term number for the initial term, used for models of the form $T_0^*f(T_i)$ in which the order matters
<code>control</code>	list of parameters controlling the convergence, see <code>Def_Control()</code> for options or <code>vignette("Control_Options")</code>
<code>guesses_control</code>	list of parameters to control how the guessing works, see <code>Def_Control_Guess()</code> for options or <code>vignette("Control_Options")</code>
<code>model_control</code>	controls which alternative model options are used, see <code>Def_model_control()</code> for options and <code>vignette("Control_Options")</code> for further details

**Value**

returns a list of the final results

**Examples**

```
library(data.table)
a <- c(0,1,2,3,4,5,6)
b <- c(1,2,3,4,5,6,7)
c <- c(0,1,0,0,0,1,0)
d <- c(3,4,5,6,7,8,9)
df <- data.table::data.table("a"=a, "b"=b, "c"=c, "d"=d)
time1 <- "a"
time2 <- "b"
event <- "c"
names <- c("d")
term_n <- c(0)
tform <- c("loglin")
keep_constant <- c(0)
a_n <- c(-0.1)
a_n_default <- a_n
modelform <- "M"
fir <- 0
der_iden <- 0
control <- list("ncores"=2, 'lr' = 0.75, 'maxiter' = -1, 'halfmax' = 5, 'epsilon' = 1e-9,
                 'deriv_epsilon' = 1e-9, 'abs_max'=1.0, 'change_all'=TRUE,
                 'dose_abs_max'=100.0, 'verbose'=FALSE, 'ties'='breslow', 'double_step'=1)
guesses_control <- list()
model_control <- list()
all_names <- unique(names(df))
dfc <- match(names, all_names)
term_tot <- max(term_n)+1
x_all <- as.matrix(df[, all_names, with = FALSE])
control <- Def_Control(control)
guesses_control <- Def_Control_Guess(guesses_control, a_n)
model_control <- Def_Model_Control(model_control)
Gather_Guesses_CPP(df, dfc, names, term_n, tform, keep_constant, a_n, x_all, a_n_default,
                    modelform, fir, control, guesses_control)
```

---

gcc_version	<i>Checks default c++ compiler</i>
-------------	------------------------------------

---

**Description**

gcc\_version Checks default c++ compiler, part of configuration script

**Usage**

```
gcc_version()
```

**Value**

returns a string representation of gcc, clang, or c++ output

---

gen_time_dep	<i>Applies time dependence to parameters</i>
--------------	--

---

**Description**

gen\_time\_dep generates a new dataframe with time dependent covariates by applying a grid in time

**Usage**

```
gen_time_dep(
  df,
  time1,
  time2,
  event0,
  iscox,
  dt,
  new_names,
  dep_cols,
  func_form,
  fname,
  tform,
  nthreads = as.numeric(detectCores())
)
```

## Arguments

df	a data.table containing the columns of interest
time1	column used for time period starts
time2	column used for time period end
event0	column used for event status
iscox	boolean if rows not at event times should not be kept, rows are removed if true. a Cox proportional hazards model does not use rows with intervals not containing event times
dt	spacing in time for new rows
new_names	list of new names to use instead of default, default used if entry is ''
dep_cols	columns that are not needed in the new dataframe
func_form	vector of functions to apply to each time-dependent covariate. Of the form func(df, time) returning a vector of the new column value
fname	filename used for new dataframe
tform	list of string function identifiers, used for linear/step
nthreads	number of threads to use, do not use more threads than available on your machine

## Value

returns the updated dataframe

## See Also

## Examples

```
library(data.table)
#Adapted from the tests
a <- c(20,20,5,10,15)
b <- c(1,2,1,1,2)
c <- c(0,0,1,1,1)
df <- data.table::data.table("a"=a,"b"=b,"c"=c)
time1 <- "%trunc%"
time2 <- "a"
event <- "c"
control <- list('lr' = 0.75,'maxiter' = -1,'halfmax' = 5,'epsilon' = 1e-9,
                 'deriv_epsilon' = 1e-9, 'abs_max'=1.0,'change_all'=TRUE,'dose_abs_max'=100.0,
                 'verbose'=FALSE, 'ties'='breslow','double_step'=1)
grt_f <- function(df,time_col){
  return ((df[, "b"] * df[,get(time_col)])[[1]])
}
```

```

func_form <- c("lin")
df_new <- gen_time_dep(df,time1,time2,event,TRUE,0.01,c("grt"),c(),
                       c(grt_f),paste("test","_new.csv",sep=""), func_form,2)
file.remove('test_new.csv')

```

**GetCensWeight**

*Calculates and returns data for time by hazard and survival to estimate censoring rate*

**Description**

GetCensWeight uses user provided data, time/event columns, vectors specifying the model, and options generate an estimate of the censoring rate, plots, and returns the data

**Usage**

```

GetCensWeight(
  df,
  time1,
  time2,
  event0,
  names,
  term_n,
  tform,
  keep_constant,
  a_n,
  modelform,
  fir,
  control,
  plot_options,
  model_control = list(),
  strat_col = "e"
)

```

**Arguments**

df	a data.table containing the columns of interest
time1	column used for time period starts
time2	column used for time period end
event0	column used for event status
names	columns for elements of the model, used to identify data columns
term_n	term numbers for each element of the model
tform	list of string function identifiers, used for linear/step
keep_constant	binary values to denote which parameters to change

<code>a_n</code>	list of initial parameter values, used to determine number of parameters. May be either a list of vectors or a single vector.
<code>modelform</code>	string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E
<code>fir</code>	term number for the initial term, used for models of the form $T0*f(Ti)$ in which the order matters
<code>control</code>	list of parameters controlling the convergence, see <code>Def_Control()</code> for options or <code>vignette("Control_Options")</code>
<code>plot_options</code>	list of parameters controlling the plot options, see <code>RunCoxPlots()</code> for different options
<code>model_control</code>	controls which alternative model options are used, see <code>Def_model_control()</code> for options and <code>vignette("Control_Options")</code> for further details
<code>strat_col</code>	column to stratify by if needed

### Value

saves the plots in the current directory and returns a `data.table` of time and corresponding hazard, cumulative hazard, and survival

### Examples

```
library(data.table)
## basic example code reproduced from the starting-description vignette

df <- data.table::data.table("UserID"=c(112, 114, 213, 214, 115, 116, 117),
                             "Starting_Age"=c(18, 20, 18, 19, 21, 20, 18),
                             "Ending_Age"=c(30, 45, 57, 47, 36, 60, 55),
                             "Cancer_Status"=c(0, 0, 1, 0, 1, 0, 0),
                             "a"=c(0, 1, 1, 0, 1, 0, 1),
                             "b"=c(1, 1.1, 2.1, 2, 0.1, 1, 0.2),

surv_ref <- dft$surv
t_c <- df$t1
cens_weight <- approx(t_ref, surv_ref, t_c, rule=2)$y
```

---

**get\_os***Checks system OS***Description**

`get_os` checks the system OS, part of configuration script

**Usage**

```
get_os()
```

**Value**

returns a string representation of OS

**interact\_them***Defines Interactions***Description**

`interact_them` uses user provided interactions define interaction terms and update the data.table. assumes interaction is "+" or "\*" and applies basic anti-aliasing to avoid duplicates

**Usage**

```
interact_them(df, interactions, new_names, verbose = 0)
```

**Arguments**

- |                           |   |
|---------------------------|---|
| <code>df</code>           | a data.table containing the columns of interest   |
| <code>interactions</code> | array of strings, each one is of form <code>term1?*?term2</code> " for term1 interaction of type * or + with term2, "?" dlimits |
| <code>new_names</code>    | list of new names to use instead of default, default used if entry is "   |

**verbose** integer valued 0-4 controlling what information is printed to the terminal. Each level includes the lower levels. 0: silent, 1: errors printed, 2: warnings printed, 3: notes printed, 4: debug information printed. Errors are situations that stop the regression, warnings are situations that assume default values that the user might not have intended, notes provide information on regression progress, and debug prints out C++ progress and intermediate results. The default level is 2 and True/False is converted to 3/0.

### Value

returns a list with two named fields. df for the updated dataframe, and cols for the new column names

### See Also

new_names <- c("ab", "ac")
vals <- interact_them(df, interactions, new_names)
df <- vals$df
new_col <- vals$cols
```

**Joint\_Multiple\_Events** Automates creating data for a joint competing risks analysis

### Description

`Joint_Multiple_Events` generates input for a regression with multiple non-independent events and models

### Usage

```
Joint_Multiple_Events(
  df,
  events,
  name_list,
```

```

    term_n_list = list(),
    tform_list = list(),
    keep_constant_list = list(),
    a_n_list = list()
)

```

### Arguments

df	a data.table containing the columns of interest
events	vector of event column names
name_list	list of vectors for columns for event specific or shared model elements, required
term_n_list	list of vectors for term numbers for event specific or shared model elements, defaults to term 0
tform_list	list of vectors for subterm types for event specific or shared model elements, defaults to loglinear
keep_constant_list	list of vectors for constant elements for event specific or shared model elements, defaults to free (0)
a_n_list	list of vectors for parameter values for event specific or shared model elements, defaults to term 0

### Value

returns the updated dataframe and model inputs

### See Also

```

**Likelihood\_Ratio\_Test** *Defines the likelihood ratio test*

## Description

`Likelihood_Ratio_Test` uses two models and calculates the ratio

## Usage

```
Likelihood_Ratio_Test(alternative_model, null_model)
```

## Arguments

alternative_model	the new model of interest in list form, output from a poisson regression
null_model	a model to compare against, in list form

## Value

returns the score statistic

## Examples

```

library(data.table)
#In an actual example, one would run two seperate RunCoxRegression regressions,
#   assigning the results to e0 and e1
e0 <- list("name"="First Model", "LogLik"=-120)

```

```
e1 <- list("name"="New Model", "LogLik"=-100)
score <- Likelihood_Ratio_Test(e1, e0)
```

**Linked\_Dose\_Formula**     *Calculates Full Parameter list for Special Dose Formula*

## Description

**Linked\_Dose\_Formula** Calculates all parameters for linear-quadratic and linear-exponential linked formulas

## Usage

```
Linked_Dose_Formula(tforms, paras, verbose = 0)
```

## Arguments

tforms	list of formula types
paras	list of formula parameters
verbose	integer valued 0-4 controlling what information is printed to the terminal. Each level includes the lower levels. 0: silent, 1: errors printed, 2: warnings printed, 3: notes printed, 4: debug information printed. Errors are situations that stop the regression, warnings are situations that assume default values that the user might not have intended, notes provide information on regression progress, and debug prints out C++ progress and intermediate results. The default level is 2 and True/False is converted to 3/0.

## Value

returns list of full parameters

## Examples

```
library(data.table)
tforms <- list("cov_0"="quad", "cov_1"="exp")
paras <- list("cov_0"=c(1,3.45), "cov_1"=c(1.2, 4.5, 0.1))
full_paras <- Linked_Dose_Formula(tforms, paras)
```

---

Linked_Lin_Exp_Para	<i>Calculates The Additional Parameter For a linear-exponential formula with known maximum</i>
---------------------	--

---

## Description

Linked\_Lin\_Exp\_Para Calculates what the additional parameter would be for a desired maximum

## Usage

```
Linked_Lin_Exp_Para(y, a0, a1_goal, verbose = 0)
```

## Arguments

y	point formula switch
a0	linear slope
a1_goal	exponential maximum desired
verbose	integer valued 0-4 controlling what information is printed to the terminal. Each level includes the lower levels. 0: silent, 1: errors printed, 2: warnings printed, 3: notes printed, 4: debug information printed. Errors are situations that stop the regression, warnings are situations that assume default values that the user might not have intended, notes provide information on regression progress, and debug prints out C++ progress and intermediate results. The default level is 2 and True/False is converted to 3/0.

## Value

returns parameter used by Colossus

## Examples

```
library(data.table)
y <- 7.6
a0 <- 1.2
a1_goal <- 15
full_paras <- Linked_Lin_Exp_Para(y,a0,a1_goal)
```

OMP_Check	<i>Checks the OMP flag</i>
-----------	----------------------------

**Description**

OMP\_Check Called directly from R, checks the omp flag and returns if omp is enabled

**Usage**

```
OMP_Check()
```

**Value**

boolean: True for OMP allowed

Rcomp_version	<i>Checks how R was compiled</i>
---------------	----------------------------------

**Description**

Rcomp\_version Checks how R was compiled, part of configuration script

**Usage**

```
Rcomp_version()
```

**Value**

returns a string representation of gcc, clang, or R CMD config CC output

Rcpp_version	<i>Checks default R c++ compiler</i>
--------------	--------------------------------------

**Description**

Rcpp\_version checks ~/.R/Makevars script for default compilers set, part of configuration script

**Usage**

```
Rcpp_version()
```

**Value**

returns a string representation of gcc, clang, or head ~/.R/Makevars

---

Replace_Missing	<i>Automatically assigns missing values in listed columns</i>
-----------------	---

---

## Description

Replace\_Missing checks each column and fills in NA values

## Usage

```
Replace_Missing(df, name_list, msv, verbose = FALSE)
```

## Arguments

df	a data.table containing the columns of interest
name_list	vector of string column names to check
msv	value to replace na with, same used for every column used
verbose	integer valued 0-4 controlling what information is printed to the terminal. Each level includes the lower levels. 0: silent, 1: errors printed, 2: warnings printed, 3: notes printed, 4: debug information printed. Errors are situations that stop the regression, warnings are situations that assume default values that the user might not have intended, notes provide information on regression progress, and debug prints out C++ progress and intermediate results. The default level is 2 and True/False is converted to 3/0.

## Value

returns a filled datatable

## See Also

                            "Ending_Age"=c(30, 45, NA, 47, 36, NA, 55),
                            "Cancer_Status"=c(0, 0, 1, 0, 1, 0, 0))
df <- Replace_Missing(df, c("Starting_Age", "Ending_Age"), 70)
```

RunCoxNull	<i>Performs basic Cox Proportional Hazards regression with the null model</i>
------------	---

## Description

RunCoxRegression uses user provided data and time/event columns to calculate the log-likelihood with constant hazard ratio

## Usage

```
RunCoxNull(df, time1, time2, event0, control)
```

## Arguments

df	a data.table containing the columns of interest
time1	column used for time period starts
time2	column used for time period end
event0	column used for event status
control	list of parameters controlling the convergence, see Def_Control() for options or vignette("Control_Options")

## Value

returns a list of the final results

## See Also

```

**RunCoxPlots***Performs Cox Proportional Hazard model plots***Description**

`RunCoxPlots` uses user provided data, time/event columns, vectors specifying the model, and options to choose and save plots

**Usage**

```
RunCoxPlots(
  df,
  time1,
  time2,
  event0,
  names,
  term_n,
  tform,
  keep_constant,
  a_n,
  modelform,
  fir,
  control,
  plot_options,
  model_control = list()
)
```

**Arguments**

<code>df</code>	a <code>data.table</code> containing the columns of interest
<code>time1</code>	column used for time period starts
<code>time2</code>	column used for time period end
<code>event0</code>	column used for event status
<code>names</code>	columns for elements of the model, used to identify data columns
<code>term_n</code>	term numbers for each element of the model
<code>tform</code>	list of string function identifiers, used for linear/step
<code>keep_constant</code>	binary values to denote which parameters to change
<code>a_n</code>	list of initial parameter values, used to determine number of parameters. May be either a list of vectors or a single vector.
<code>modelform</code>	string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E

<code>fir</code>	term number for the initial term, used for models of the form $T_0 * f(T_i)$ in which the order matters
<code>control</code>	list of parameters controlling the convergence, see <code>Def_Control()</code> for options or <code>vignette("Control_Options")</code>
<code>plot_options</code>	list of parameters controlling the plot options, see <code>RunCoxPlots()</code> for different options
<code>model_control</code>	controls which alternative model options are used, see <code>Def_model_control()</code> for options and <code>vignette("Control_Options")</code> for further details

**Value**

saves the plots in the current directory and returns a string

**See Also**

### RunCoxRegression\_Guesses\_CPP

*Performs basic Cox Proportional Hazards regression, Generates multiple starting guesses on c++ side*

## Description

RunCoxRegression\_Guesses\_CPP uses user provided data, time/event columns, vectors specifying the model, and options to control the convergence and starting positions. Has additional options to starting with several initial guesses

## Usage

```
RunCoxRegression_Guesses_CPP(
  df,
  time1,
  time2,
  event0,
  names,
  term_n,
  tform,
  keep_constant,
  a_n,
  modelform,
  fir,
  der_iden,
  control,
  guesses_control,
  strat_col,
  model_control = list(),
  cens_weight = "null"
)
```

## Arguments

<code>df</code>	a data.table containing the columns of interest
<code>time1</code>	column used for time period starts
<code>time2</code>	column used for time period end
<code>event0</code>	column used for event status
<code>names</code>	columns for elements of the model, used to identify data columns
<code>term_n</code>	term numbers for each element of the model
<code>tform</code>	list of string function identifiers, used for linear/step
<code>keep_constant</code>	binary values to denote which parameters to change
<code>a_n</code>	list of initial parameter values, used to determine number of parameters. May be either a list of vectors or a single vector.
<code>modelform</code>	string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E
<code>fir</code>	term number for the initial term, used for models of the form $T_0*f(T_i)$ in which the order matters
<code>der_iden</code>	number for the subterm to test derivative at, only used for testing runs with a single varying parameter, should be smaller than total number of parameters. indexed starting at 0

<code>control</code>	list of parameters controlling the convergence, see <code>Def_Control()</code> for options or <code>vignette("Control_Options")</code>
<code>guesses_control</code>	list of parameters to control how the guessing works, see <code>Def_Control_Guess()</code> for options or <code>vignette("Control_Options")</code>
<code>strat_col</code>	column to stratify by if needed
<code>model_control</code>	controls which alternative model options are used, see <code>Def_model_control()</code> for options and <code>vignette("Control_Options")</code> for further details
<code>cens_weight</code>	column containing the row weights

## Value

returns a list of the final results

## See Also

```

**Arguments**

df	a data.table containing the columns of interest
----	---

time1	column used for time period starts
time2	column used for time period end
event0	column used for event status
names	columns for elements of the model, used to identify data columns
term_n	term numbers for each element of the model
tform	list of string function identifiers, used for linear/step
keep_constant	binary values to denote which parameters to change
a_n	list of initial parameter values, used to determine number of parameters. May be either a list of vectors or a single vector.
modelform	string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E
fir	term number for the initial term, used for models of the form T0*f(Ti) in which the order matters
der_iden	number for the subterm to test derivative at, only used for testing runs with a single varying parameter, should be smaller than total number of parameters. indexed starting at 0
control	list of parameters controlling the convergence, see Def_Control() for options or vignette("Control_Options")
strat_col	column to stratify by if needed
cens_weight	column containing the row weights
model_control	controls which alternative model options are used, see Def_model_control() for options and vignette("Control_Options") for further details
cons_mat	Matrix containing coefficients for system of linear constraints, formatted as matrix
cons_vec	Vector containing constants for system of linear constraints, formatted as vector

## Value

returns a list of the final results

**RunCoxRegression\_Omnibus\_Multidose**

*Performs Cox Proportional Hazards regression using the omnibus function with multiple column realizations*

**Description**

RunCoxRegression\_Omnibus\_Multidose uses user provided data, time/event columns, vectors specifying the model, and options to control the convergence and starting positions. Used for 2DMC column uncertainty methods. Returns optimized parameters, log-likelihood, and standard deviation for each realization. Has additional options for using stratification, multiplicative loglinear 1-term, competing risks, and calculation without derivatives

**Usage**

```
RunCoxRegression_Omnibus_Multidose(
  df,
  time1 = "start",
```

```

    time2 = "end",
    event0 = "event",
    names = c("CONST"),
    term_n = c(0),
    tform = "loglin",
    keep_constant = c(0),
    a_n = c(0),
    modelform = "M",
    fir = 0,
    der_iden = 0,
    realization_columns = matrix(c("temp00", "temp01", "temp10", "temp11"), nrow = 2),
    realization_index = c("temp0", "temp1"),
    control = list(),
    strat_col = "null",
    cens_weight = "null",
    model_control = list(),
    cons_mat = as.matrix(c(0)),
    cons_vec = c(0)
)

```

## Arguments

df	a data.table containing the columns of interest
time1	column used for time period starts
time2	column used for time period end
event0	column used for event status
names	columns for elements of the model, used to identify data columns
term_n	term numbers for each element of the model
tform	list of string function identifiers, used for linear/step
keep_constant	binary values to denote which parameters to change
a_n	list of initial parameter values, used to determine number of parameters. May be either a list of vectors or a single vector.
modelform	string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E
fir	term number for the initial term, used for models of the form $T_0*f(T_i)$ in which the order matters
der_iden	number for the subterm to test derivative at, only used for testing runs with a single varying parameter, should be smaller than total number of parameters. indexed starting at 0
realization_columns	used for multi-realization regressions. Matrix of column names with rows for each column with realizations, columns for each realization
realization_index	used for multi-realization regressions. Vector of column names, one for each column with realizations. each name should be used in the "names" variable in the equation definition

control	list of parameters controlling the convergence, see Def_Control() for options or vignette("Control_Options")
strat_col	column to stratify by if needed
cens_weight	column containing the row weights
model_control	controls which alternative model options are used, see Def_model_control() for options and vignette("Control_Options") for further details
cons_mat	Matrix containing coefficients for system of linear constraints, formatted as matrix
cons_vec	Vector containing constants for system of linear constraints, formatted as vector

**Value**

returns a list of the final results for each realization

```

---

**RunCoxRegression\_Single**

*Performs basic Cox Proportional Hazards calculation with no derivative*

---

**Description**

RunCoxRegression\_Single uses user provided data, time/event columns, vectors specifying the model, and options and returns the log-likelihood

**Usage**

```
RunCoxRegression_Single(
  df,
  time1,
  time2,
  event0,
  names,
  term_n,
  tform,
  keep_constant,
  a_n,
  modelform,
  fir,
  control
)
```

**Arguments**

df	a data.table containing the columns of interest
time1	column used for time period starts
time2	column used for time period end
event0	column used for event status

names	columns for elements of the model, used to identify data columns
term_n	term numbers for each element of the model
tform	list of string function identifiers, used for linear/step
keep_constant	binary values to denote which parameters to change
a_n	list of initial parameter values, used to determine number of parameters. May be either a list of vectors or a single vector.
modelform	string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E
fir	term number for the initial term, used for models of the form $T_0^*f(T_i)$ in which the order matters
control	list of parameters controlling the convergence, see Def_Control() for options or vignette("Control_Options")

### RunCoxRegression\_Tier\_Guesses

*Performs basic cox regression, with multiple guesses, starts with solving for a single term*

### Description

RunCoxRegression\_Tier\_Guesses uses user provided data, time/event columns, vectors specifying the model, and options to control the convergence and starting positions, with additional guesses

### Usage

```

RunCoxRegression_Tier_Guesses(
  df,
  time1,
  time2,
  event0,
  names,
  term_n,
  tform,
  keep_constant,
  a_n,
  modelform,
  fir,
  der_iden,
  control,
  guesses_control,
  strat_col,
  model_control = list(),
  cens_weight = "null"
)

```

### Arguments

- |       |   |
|-------|---|
| df    | a data.table containing the columns of interest |
| time1 | column used for time period starts              |

time2	column used for time period end
event0	column used for event status
names	columns for elements of the model, used to identify data columns
term_n	term numbers for each element of the model
tform	list of string function identifiers, used for linear/step
keep_constant	binary values to denote which parameters to change
a_n	list of initial parameter values, used to determine number of parameters. May be either a list of vectors or a single vector.
modelform	string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E
fir	term number for the initial term, used for models of the form $T0*f(Ti)$ in which the order matters
der_iden	number for the subterm to test derivative at, only used for testing runs with a single varying parameter, should be smaller than total number of parameters. indexed starting at 0
control	list of parameters controlling the convergence, see Def_Control() for options or vignette("Control_Options")
guesses_control	list of parameters to control how the guessing works, see Def_Control_Guess() for options or vignette("Control_Options")
strat_col	column to stratify by if needed
model_control	controls which alternative model options are used, see Def_model_control() for options and vignette("Control_Options") for further details
cens_weight	column containing the row weights

## Value

returns a list of the final results

### RunPoissonEventAssignment

*Predicts how many events are due to baseline vs excess*

### Description

RunPoissonEventAssignment uses user provided data, person-year/event columns, vectors specifying the model, and options to calculate background and excess events

### Usage

```
RunPoissonEventAssignment(
  df,
  pyr0,
  event0,
  names,
```

```

  term_n,
  tform,
  keep_constant,
  a_n,
  modelform,
  fir,
  der_iden,
  control,
  strat_col = "null",
  model_control = list()
)

```

## Arguments

df	a data.table containing the columns of interest
pyr0	column used for person-years per row
event0	column used for event status
names	columns for elements of the model, used to identify data columns
term_n	term numbers for each element of the model
tform	list of string function identifiers, used for linear/step
keep_constant	binary values to denote which parameters to change
a_n	list of initial parameter values, used to determine number of parameters. May be either a list of vectors or a single vector.
modelform	string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E
fir	term number for the initial term, used for models of the form $T_0 * f(T_i)$ in which the order matters
der_iden	number for the subterm to test derivative at, only used for testing runs with a single varying parameter, should be smaller than total number of parameters. indexed starting at 0
control	list of parameters controlling the convergence, see Def_Control() for options or vignette("Control_Options")
strat_col	column to stratify by if needed
model_control	controls which alternative model options are used, see Def_model_control() for options and vignette("Control_Options") for further details

## Value

returns a list of the final results

```

### RunPoissonEventAssignment\_bound

*Predicts how many events are due to baseline vs excess at the confidence bounds of a single parameter*

## Description

RunPoissonEventAssignment\_bound uses user provided data, the results of a poisson regression, and options to calculate background and excess events

## Usage

```
RunPoissonEventAssignment_bound(
  df,
  pyr0,
  event0,
```

```

    alternative_model,
    keep_constant,
    modelform,
    fir,
    der_iden,
    check_num = 1,
    z = 2,
    control = list(),
    strat_col = "null",
    model_control = list()
)

```

### Arguments

<code>df</code>	a data.table containing the columns of interest
<code>pyr0</code>	column used for person-years per row
<code>event0</code>	column used for event status
<code>alternative_model</code>	the new model of interest in list form, output from a poisson regression
<code>keep_constant</code>	binary values to denote which parameters to change
<code>modelform</code>	string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E
<code>fir</code>	term number for the initial term, used for models of the form $T_0^*f(T_i)$ in which the order matters
<code>der_iden</code>	number for the subterm to test derivative at, only used for testing runs with a single varying parameter, should be smaller than total number of parameters. indexed starting at 0
<code>check_num</code>	the parameter number to check at the bounds of, indexed from 1 using the order returned by Colossus
<code>z</code>	Z score to use for confidence interval
<code>control</code>	list of parameters controlling the convergence, see <code>Def_Control()</code> for options or <code>vignette("Control_Options")</code>
<code>strat_col</code>	column to stratify by if needed
<code>model_control</code>	controls which alternative model options are used, see <code>Def_model_control()</code> for options and <code>vignette("Control_Options")</code> for further details

### Value

returns a list of the final results

RunPoissonRegression   *Performs basic poisson regression*

## Description

RunPoissonRegression uses user provided data, person-year/event columns, vectors specifying the model, and options to control the convergence and starting positions with no special options

**Usage**

```
RunPoissonRegression(
  df,
  pyr0,
  event0,
  names,
  term_n,
  tform,
  keep_constant,
  a_n,
  modelform,
  fir,
  der_iden,
  control
)
```

**Arguments**

df	a data.table containing the columns of interest
pyr0	column used for person-years per row
event0	column used for event status
names	columns for elements of the model, used to identify data columns
term_n	term numbers for each element of the model
tform	list of string function identifiers, used for linear/step
keep_constant	binary values to denote which parameters to change
a_n	list of initial parameter values, used to determine number of parameters. May be either a list of vectors or a single vector.
modelform	string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E
fir	term number for the initial term, used for models of the form $T_0 * f(T_i)$ in which the order matters
der_iden	number for the subterm to test derivative at, only used for testing runs with a single varying parameter, should be smaller than total number of parameters. indexed starting at 0
control	list of parameters controlling the convergence, see Def_Control() for options or vignette("Control_Options")

**Value**

returns a list of the final results

```

### RunPoissonRegression\_Guesses\_CPP

*Performs basic Poisson regression, generates multiple starting guesses on c++ side*

## Description

RunPoissonRegression\_Guesses\_CPP uses user provided data, time/event columns, vectors specifying the model, and options to control the convergence and starting positions. Has additional options to starting with several initial guesses

## Usage

```
RunPoissonRegression_Guesses_CPP(
  df,
  pyr0,
```

```

event0,
names,
term_n,
tform,
keep_constant,
a_n,
modelform,
fir,
der_iden,
control,
guesses_control,
strat_col = c("null"),
model_control = list()
)

```

### Arguments

<code>df</code>	a data.table containing the columns of interest
<code>pyr0</code>	column used for person-years per row
<code>event0</code>	column used for event status
<code>names</code>	columns for elements of the model, used to identify data columns
<code>term_n</code>	term numbers for each element of the model
<code>tform</code>	list of string function identifiers, used for linear/step
<code>keep_constant</code>	binary values to denote which parameters to change
<code>a_n</code>	list of initial parameter values, used to determine number of parameters. May be either a list of vectors or a single vector.
<code>modelform</code>	string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E
<code>fir</code>	term number for the initial term, used for models of the form $T_0*f(T_i)$ in which the order matters
<code>der_iden</code>	number for the subterm to test derivative at, only used for testing runs with a single varying parameter, should be smaller than total number of parameters. indexed starting at 0
<code>control</code>	list of parameters controlling the convergence, see <code>Def_Control()</code> for options or <code>vignette("Control_Options")</code>
<code>guesses_control</code>	list of parameters to control how the guessing works, see <code>Def_Control_Guess()</code> for options or <code>vignette("Control_Options")</code>
<code>strat_col</code>	column to stratify by if needed
<code>model_control</code>	controls which alternative model options are used, see <code>Def_model_control()</code> for options and <code>vignette("Control_Options")</code> for further details

### Value

returns a list of the final results

**RunPoissonRegression\_Joint\_Omnibus**

*Performs joint Poisson regression using the omnibus function*

## Description

`RunPoissonRegression_Joint_Omnibus` uses user provided data, time/event columns, vectors specifying the model, and options to control the convergence and starting positions. Has additional options to starting with several initial guesses, uses joint competing risks equation

## Usage

```
RunPoissonRegression_Joint_Omnibus(
  df,
  pyr0,
  events,
  name_list,
  term_n_list = list(),
  tform_list = list(),
  keep_constant_list = list(),
  a_n_list = list(),
  modelform = "M",
  fir = 0,
  der_iden = 0,
  control = list(),
  strat_col = "null",
  model_control = list(),
  cons_mat = as.matrix(c(0)),
  cons_vec = c(0)
)
```

## Arguments

<code>df</code>	a data.table containing the columns of interest
<code>pyr0</code>	column used for person-years per row
<code>events</code>	vector of event column names
<code>name_list</code>	list of vectors for columns for event specific or shared model elements, required
<code>term_n_list</code>	list of vectors for term numbers for event specific or shared model elements, defaults to term 0
<code>tform_list</code>	list of vectors for subterm types for event specific or shared model elements, defaults to loglinear
<code>keep_constant_list</code>	list of vectors for constant elements for event specific or shared model elements, defaults to free (0)
<code>a_n_list</code>	list of vectors for parameter values for event specific or shared model elements, defaults to term 0
<code>modelform</code>	string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E
<code>fir</code>	term number for the initial term, used for models of the form $T_0 * f(T_i)$ in which the order matters

<code>der_iden</code>	number for the subterm to test derivative at, only used for testing runs with a single varying parameter, should be smaller than total number of parameters. indexed starting at 0
<code>control</code>	list of parameters controlling the convergence, see <code>Def_Control()</code> for options or <code>vignette("Control_Options")</code>
<code>strat_col</code>	column to stratify by if needed
<code>model_control</code>	controls which alternative model options are used, see <code>Def_model_control()</code> for options and <code>vignette("Control_Options")</code> for further details
<code>cons_mat</code>	Matrix containing coefficients for system of linear constraints, formatted as matrix
<code>cons_vec</code>	Vector containing constants for system of linear constraints, formatted as vector

### Value

returns a list of the final results

                                         modelform, fir, der_iden, control, strat_col)

```

**RunPoissonRegression\_Omnibus***Performs basic Poisson regression using the omnibus function***Description**

RunPoissonRegression\_Omnibus uses user provided data, time/event columns, vectors specifying the model, and options to control the convergence and starting positions. Has additional options to starting with several initial guesses

**Usage**

```
RunPoissonRegression_Omnibus(
  df,
  pyr0 = "pyr",
  event0 = "event",
  names = c("CONST"),
  term_n = c(0),
  tform = "loglin",
  keep_constant = c(0),
  a_n = c(0),
  modelform = "M",
```

```

    fir = 0,
    der_iden = 0,
    control = list(),
    strat_col = "null",
    model_control = list(),
    cons_mat = as.matrix(c(0)),
    cons_vec = c(0)
)

```

## Arguments

df	a data.table containing the columns of interest
pyr0	column used for person-years per row
event0	column used for event status
names	columns for elements of the model, used to identify data columns
term_n	term numbers for each element of the model
tform	list of string function identifiers, used for linear/step
keep_constant	binary values to denote which parameters to change
a_n	list of initial parameter values, used to determine number of parameters. May be either a list of vectors or a single vector.
modelform	string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E
fir	term number for the initial term, used for models of the form $T_0 * f(T_i)$ in which the order matters
der_iden	number for the subterm to test derivative at, only used for testing runs with a single varying parameter, should be smaller than total number of parameters. indexed starting at 0
control	list of parameters controlling the convergence, see Def_Control() for options or vignette("Control_Options")
strat_col	column to stratify by if needed
model_control	controls which alternative model options are used, see Def_model_control() for options and vignette("Control_Options") for further details
cons_mat	Matrix containing coefficients for system of linear constraints, formatted as matrix
cons_vec	Vector containing constants for system of linear constraints, formatted as vector

## Value

returns a list of the final results

## See Also

### RunPoissonRegression\_STRATA

*Performs poisson regression with strata effect*

## Description

RunPoissonRegression\_STRATA uses user provided data, time/event columns, vectors specifying the model, and options to control the convergence and starting positions

**Usage**

```
RunPoissonRegression_STRATA(
  df,
  pyr0,
  event0,
  names,
  term_n,
  tform,
  keep_constant,
  a_n,
  modelform,
  fir,
  der_iden,
  control,
  strat_col
)
```

**Arguments**

<code>df</code>	a data.table containing the columns of interest
<code>pyr0</code>	column used for person-years per row
<code>event0</code>	column used for event status
<code>names</code>	columns for elements of the model, used to identify data columns
<code>term_n</code>	term numbers for each element of the model
<code>tform</code>	list of string function identifiers, used for linear/step
<code>keep_constant</code>	binary values to denote which parameters to change
<code>a_n</code>	list of initial parameter values, used to determine number of parameters. May be either a list of vectors or a single vector.
<code>modelform</code>	string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E
<code>fir</code>	term number for the initial term, used for models of the form $T_0*f(T_i)$ in which the order matters
<code>der_iden</code>	number for the subterm to test derivative at, only used for testing runs with a single varying parameter, should be smaller than total number of parameters. indexed starting at 0
<code>control</code>	list of parameters controlling the convergence, see <code>Def_Control()</code> for options or <code>vignette("Control_Options")</code>
<code>strat_col</code>	column to stratify by if needed

**Value**

returns a list of the final results

**See Also**

e <- RunPoissonRegression_STRATA(df, pyr, event, names, term_n, tform, keep_constant,
  a_n, modelform, fir, der_iden, control, strat_col)
```

**RunPoissonRegression\_Tier\_Guesses**

*Performs basic poisson regression, with multiple guesses, starts with a single term*

## Description

*RunPoissonRegression\_Tier\_Guesses* uses user provided data, time/event columns, vectors specifying the model, and options to control the convergence and starting positions, with additional guesses

## Usage

```
RunPoissonRegression_Tier_Guesses(
  df,
  pyr0,
  event0,
  names,
  term_n,
  tform,
  keep_constant,
  a_n,
  modelform,
  fir,
  der_iden,
  control,
  guesses_control,
  strat_col
)
```

## Arguments

<code>df</code>	a data.table containing the columns of interest
<code>pyr0</code>	column used for person-years per row
<code>event0</code>	column used for event status
<code>names</code>	columns for elements of the model, used to identify data columns
<code>term_n</code>	term numbers for each element of the model
<code>tform</code>	list of string function identifiers, used for linear/step
<code>keep_constant</code>	binary values to denote which parameters to change
<code>a_n</code>	list of initial parameter values, used to determine number of parameters. May be either a list of vectors or a single vector.
<code>modelform</code>	string specifying the model type: M, ME, A, PA, PAE, GMIX, GMIX-R, GMIX-E
<code>fir</code>	term number for the initial term, used for models of the form $T_0*f(T_i)$ in which the order matters
<code>der_iden</code>	number for the subterm to test derivative at, only used for testing runs with a single varying parameter, should be smaller than total number of parameters. indexed starting at 0
<code>control</code>	list of parameters controlling the convergence, see <code>Def_Control()</code> for options or <code>vignette("Control_Options")</code>

guesses\_control  
 list of parameters to control how the guessing works, see Def\_Control\_Guess()  
 for options or vignette("Control\_Options")  
 strat\_col column to stratify by if needed

**Value**

returns a list of the final results

**See Also**

```

System_Version	<i>Checks OS, compilers, and OMP</i>
----------------	--------------------------------------

### Description

System\_Version checks OS, default R c++ compiler, and if OMP is enabled

### Usage

```
System_Version()
```

### Value

returns a list of results

Time_Since	<i>Automates creating a date since a reference column</i>
------------	---

### Description

Time\_Since generates a new dataframe with a column containing time since a reference in a given unit

### Usage

```
Time_Since(df, dcol0, tref, col_name, units = "days")
```

### Arguments

df	a data.table containing the columns of interest
dcol0	list of ending month, day, and year
tref	reference time in date format
col_name	vector of new column names
units	time unit to use

### Value

returns the updated dataframe
